ABSTRACT

As per Civil Engineering is concern, one must know the importance of good construction material. For concreting purpose, cement, sand, aggregate and water is used. Considering present scenario of material, it looks bit difficult to identify the sand for construction as the river sand is banned due to environmental impact. This project is a study of all the sand samples available at Gadhinglaj Tahsil. The available sand samples are tested for its quality and its response is assessed when added in concrete. The production cost per meter cube is calculated to decide its economy. At the same time, misunderstanding about available sand samples for its response under loading conditions is been kept in mind while going through this research work.

KEYWORDS: Compressive Strength, M-sand.

1. INTRODUCTION

Cement, sand and aggregates are essential needs for any construction industry. Sand is major material used for preparation of mortar and concrete and plays a most important role in mix design.

Now a days, demanding of river sand in construction industry is very high, in most of the construction river sand is used as the fine aggregate as the demand increases scarcity of sand also increases this leads to illegal snatching of sand from the river bed it is difficult to find out alternate material to replace sand which having same advantages such as easily availability, eco-friendly, cheap, etc. so there is need to find out other sand having same strength.

Therefore in this experimental study we are going to discuss on the comparative study of compressive strength of concrete by using various sa

Objectives

- 1) To test different properties of sand samples.
- 2) To determine the compressive strength of concrete by using various sands samples.
- 3) To compare compressive strength of concrete block prepared by using various sands samples.

4) To suggest better sand sample depending upon maximum Compressive Strength, Economy and Availability.

5) To compare the available sand samples based on production cost.

2. LITERATURE REVIEW

a. AMZ Zimar, GKPN Samarawickrama, WSD Karunarathna, S Jayakody "EFFECTS OF MANUFACTURED SAND AS A REPLACEMENT OF FINE AGGREGATES IN CONCRETE"

This paper states that, the Bulk density, Specific gravity and water absorption are higher for MS than river sand. MS shows higher fineness modulus compare to river sand because of higher clay and silt content. The

CODEN: IJESS7

Impact Factor: 5.164

workability of concrete gradually decreases with the addition of M-Sand. However, the required workability can be achieved by using water reducing admixture. Therefore, river sand can be fully replaced with manufactured sand.

b. Ganesh V. Tapkire, Vikram J. Patel, Hemaraj R. kumavat, Rajendra R. Patil, "COMPARATIVE ANALYSIS OF RIVER AND CRUSHED SAND IN CONCRETE"

This paper states that, the physical properties of crushed sand satisfies the IS requirement, But in workability test it is less workable as compare to river sand concrete. Similarly he compare the compressive strength result of concrete it is found that gives the result is 8% less than the river sand concrete. From all observations, he suggested that at the time of concreting crushed sand should be used with admixture for better workability and strength improvement of concrete.

c. Nimitha Vijayaraghavan, A. S. wayal, "EFFECTS OF MANUFACTURED SAND ON COMPRESSIVE STRENGTGH AND WORKABILITY OF CONCRETE"

This paper states that, the 100% replacement of natural sand by crushed sand, the compressive strength increases by 7.03% and the river sand can be fully replaced by artificial sand. Concrete mix becomes harsh with increase in proportion of manufactured sand.

3. METHODOLOGY

The process of performing a particular work in proper manner i.e. step by step procedure of work. The procedure of work is as follows:

- 1. Collection of materials from different places
- 2. Material Testing
- 3. Mix proportion
- 4. Cube casting
- 5. Curing of cubes
- 6. Check Compressive strength on 7 and 28 days

4. EXPERIMENTAL WORK

In this research work to determine the compressive strength of sand samples collected from Gadhinglaj tahsil, IS specified moulds of size 150mmX150mmX150mm were used. As per mix proportion of M20 (1:1.5:3) the materials were calculated. The constituents (cement, sand, aggregate, water) were weighed and the materials were mixed properly by hand mixing method. The mixes were compacted with tamping rod and vibrated on machine vibrator. These specimen were kept for 24 hours and then demolded, cured for 7and 28 days and tested as per IS standards.

5. RESULTS

- a. On the basis of experimental study results obtained are as follows:
- 1. Compressive strength of River sand

| Sr.No. | Age of cube | Weight of cube (Kg) | C/S area of cube (mm ²) | Load (KN) | Compressive strength (N/mm ²) | Avg. Comp. strength (N/mm ²) |
|--------|----------------|------------------------|---|--------------|---|--|
| 1. | | 8.550 | 22500 | 435 | 19.33 | |
| 2. | 7 Days | 8.540 | 22500 | 436 | 19.37 | 18.05 |
| 3. | | 8.470 | 22500 | 348 | 15.46 | |
| | | | | | | |
| 4. | | 8.240 | 22500 | 583 | 25.91 | |
| 5. | 28 Days | 8.400 | 22500 | 570 | 25.33 | 23.76 |
| 6. | | 8.380 | 22500 | 451 | 20.04 | |

b. Comparison based on cost and compressive strength:

| Sr.No. | Name of sand sample | Compressive strength | Cost for 1 cu.m concrete | |
|--------|-------------------------|---------------------------|--------------------------|--|
| | | On 28(N/mm ²) | preparation | |
| | | | (Rupees) | |
| 1. | River Sand | 23.76 | 4100 | |
| 2. | Hiranyakeshi River Sand | 18.97 | 3446 | |
| 3. | Begampuri Sand | 21.59 | 3921 | |
| 4. | Rajgoli Sand | 26.96 | 3508 | |
| 5. | Fonda Sand | 25.68 | 3745 | |
| 6. | Crushed sand | 19.64 | 3710 | |

6. CONCLUSION

On the basis of results obtained from the research work following conclusions are made,

- 1) As compared to River sand M-sands are easily available and economical.
- 2) Cubes manufactured from M-sands satisfy the criteria of design strength.
- 3) The compressive strength of M-sands can be improved by using admixture.
- 4) The M-sands are economical as well as good in compressive strength.
