**Abstract**

The homogeneous cone represented by the ternary quadratic Diophantine equation  $z^2 = 2x^2 + 8y^2$  is analyzed for its patterns of non zero distinct integral solutions. A few interesting relations between the solutions, special polygonal numbers, pyramidal numbers and other special numbers are exhibited.

**Keywords:** Homogeneous Cone, Ternary Quadratic, Integral Solutions. Mathematics subject classification No:11D09..

**Introduction**

The ternary quadratic diophantine equation offers an unlimited field for research because of their variety [1-2]. For an extensive review of various problems, one may refer [3-22]. This communication concerns with another interesting ternary quadratic equation  $z^2 = 2x^2 + 8y^2$  representing a homogeneous cone for determining its infinitely many non-zero integral solutions. Also a few interesting relations among the solutions have been presented.

**Notation Used**

- $T_{m,n}$  = Polygonal Number of rank n with sides m
- $p_n^m$  = Pyramidal number of rank n with sides m
- $ST_n$  = Star number of rank n
- $j_n$  = Jacobsthal-Lucas number of rank n
- $Ky_n$  = Kynea number of rank n

**Method of Analysis**

The homogeneous cone represented by the ternary quadratic equation is

$$z^2 - 8y^2 = 2x^2$$

(1)

Assume  $x = x(a, b) = a^2 - 8b^2, a, b \neq 0$

(2)

$$= (a + \sqrt{8b})(a - \sqrt{8b})$$

We present below different patterns of integral solutions of (1)

**Pattern I**

Write 2 as

$$2 = \frac{(4 + \sqrt{8})(4 - \sqrt{8})}{4}$$

(3)

Substituting (2) and (3) in (1) and employing the method of factorization, define

$$z + \sqrt{8}y = \frac{1}{2}(4 + \sqrt{8})(a + \sqrt{8}b)$$

(4)

Equating rational and irrational parts of (4), we have

$$z = z(a, b) = 2(a^2 + 8b^2 + ab)$$

(5)

and

$$y = y(a, b) = \frac{1}{2}(a^2 + 8b^2 + 8ab)$$

(6)

As our interest centers on finding integer solutions, it is possible to choose a and b suitably so that y is an integer. Thus we have the following three sets of solutions to(1).

**Case (i)**

Let  $a = 2A, b = 2B$

The corresponding solutions of (1) are

$$x = x(A, B) = 4(A^2 - 8B^2)$$

$$y = y(A, B) = 2(A^2 + 8B^2 + 8AB)$$

$$z = z(A, B) = 8(A^2 + 8B^2 + AB)$$

**Properties**

1.  $y(2^n, 1) + 16(-1)^n - 14 = 2(j_{2n} + 8j_n)$
2.  $y(2^{2n}, 1) - 8 = 2(ky_{2n} + 6j_{2n})$
3.  $x(-1, 2^{2n}) + y(-1, 2^{2n}) = 39 - (ST_{2n} + 10j_{2n} + 22j_n)$
4.  $6(z(1, B) - 4)$  is a Nasty Number

**Case(ii)**

Let  $a = 2A, b = 2B + 1$

The corresponding solutions of (1) are

$$x = x(A, B) = 4[A^2 - 8B(B + 1) - 2]$$

$$y = y(A, B) = 2[A^2 + 8B^2 + 4A + 8B + 8AB + 2]$$

$$z = z(A, B) = 8[A^2 + 8B^2 + 2A + 8B + 4AB + 2]$$

**Properties**

Each of the following expressions is a Nasty Number

1.  $6[z(2A, 1) + 4A^2 - 80]$
2.  $x(A, 1) + y(A, 1) + 60$
3.  $6[4B^2 - x(1, B) - 8B]$
4.  $6[y(-1, B) + 26]$

**Case(iii)**

Let  $a = 2nb$

The corresponding solutions of (1) are

$$x = x(n, b) = 4b^2(n^2 - 2)$$

$$y = y(n, b) = 2b^2(n^2 + 4n + 2)$$

$$z = z(n, b) = 8b^2(n^2 + 2n + 2)$$

**Properties**

1.  $x(n, 1) - y(n, 1) - T_{6, n} \equiv -5 \pmod{7}$
2.  $y(n, -1) + z(n, 1) - T_{14, n} \equiv -1 \pmod{13}$
3.  $y(n, 1) + z(n, 1) - T_{22, n} \equiv 13 \pmod{33}$
4.  $z(n, 1) - x(n, 1) - 12T_{3, n} \equiv 4 \pmod{10}$

**Pattern II**

Instead of (3), write 2 as

$$2 = \frac{(20 + \sqrt{8})(20 - \sqrt{8})}{196}$$

(7)

Following the similar procedure as in Pattern I, the integral solutions for (1) are as follows:

$$x = x(A, B) = 196[A^2 - 8B^2]$$

$$y = y(A, B) = 14[A^2 + 8B^2 + 40AB]$$

$$z = z(A, B) = 14[20A^2 + 160B^2 + 16AB]$$

**Properties**

1.  $y(A, 1) - T_{30, A} \equiv -461 \pmod{573}$

Each of the following expressions is a Nasty Number

2.  $6[x(A, 1) + 1568]$
3.  $6[z(A, 1) - y(A, 1) - T_{22, A} - 185A - 1872]$

**Pattern III**

Rewrite (1) as  $z^2 - 2x^2 = 8y^2$

(8)

Assume

$$y = y(a, b) = a^2 - 2b^2, a, b \neq 0$$

(9)

$$= (a + \sqrt{2}b)(a - \sqrt{2}b)$$

and write 8 as

$$8 = (4 + 2\sqrt{2})(4 - 2\sqrt{2})$$

(10)

For this case, the values of x and z are given by

$$x = x(a, b) = 2a^2 + 4b^2 + 8ab$$

$$z = z(a, b) = 4a^2 + 8b^2 + 8ab$$

(11)

Thus (9) and (11) represent the non-zero distinct integral solutions of (1).

**Properties**

1.  $6[x(A, 1) + 2A^2]$  is a Nasty Number.
2.  $y(A, 1) + z(A, 1) - 10T_{3, A} \equiv 0 \pmod{3}$

**Pattern IV**

Instead of (10), write 8 as

$$8 = \frac{(20 + 2\sqrt{2})(20 - 2\sqrt{2})}{49}$$

For this choice, the corresponding non-zero distinct integral solutions of (1) are obtained as

$$x = x(A, B) = 14[A^2 + 2B^2 + 20AB]$$

$$y = y(A, B) = 49[A^2 - 2B^2]$$

$$z = z(A, B) = 4[35A^2 + 70B^2 + 14AB]$$

**Properties**

1.  $x(2A, 1) - 112T_{3,A} = 504A + 28$
  2.  $z(A, 1) - y(A, 1) - T_{50,A} - T_{60,A} - T_{70,A} - 8T_{3,A} \equiv -106 \pmod{136}$
  3.  $x(1, B) + y(1, B) + 140T_{3,B} \equiv -287 \pmod{350}$
1.  $2\left(\frac{p_x^5}{T_{3,x}}\right)^2 + 8\left(\frac{p_{2y}^5}{T_{3,2y}}\right)^2$
  2.  $\left(\frac{3p_{2x}^3}{T_{3,2x+1}}\right)^2 + 8\left(\frac{p_y^3}{T_{3,y+1}}\right)^2$
  3.  $2\left(\frac{p_y^5}{T_{3,y}}\right)^2 + 72\left(\frac{p_x^3}{T_{3,x+1}}\right)^2$

**Remarkable Observation**

**I.** If the non zero integer triple  $(x_0, y_0, z_0)$  is any solution of (1), then each of the following four triples also satisfy (1)

**Triple 1:**

$$(x_{2n}, y_{2n}, z_{2n}) = 5^{2n}(x_0, y_0, z_0)$$

**Triple 2:**

$$(x_{2n-1}, y_{2n-1}, z_{2n-1}) = 5^{2n-2}(-3x_0 + 8y_0, 2x_0 + y_0, 5z_0)$$

**Triple 3:**

$(x_n, y_0, z_n)$  where

$$x_n = \beta_n x_0 + \alpha_n z_0$$

$$z_n = 2\alpha_n x_0 + \beta_n z_0$$

Here

$$\alpha_n = \frac{1}{2\sqrt{2}}[(3 + 2\sqrt{2})^{n+1} - (3 - 2\sqrt{2})^{n+1}]$$

$$\beta_n = \frac{1}{2}[(3 + 2\sqrt{2})^{n+1} + (3 - 2\sqrt{2})^{n+1}]$$

Triple 4:  $(x_0, y_n, z_n)$  where

$$y_n = \beta_{2n-1}y_0 + \alpha_{2n-1}z_0$$

$$z_n = 8\alpha_{2n-1}y_0 + \beta_{2n-1}z_0$$

Here

$$\alpha_{2n-1} = \frac{1}{2\sqrt{8}}[(3 + 2\sqrt{2})^{2n} - (3 - 2\sqrt{2})^{2n}]$$

$$\beta_{2n-1} = \frac{1}{2}[(3 + 2\sqrt{2})^{2n} + (3 - 2\sqrt{2})^{2n}]$$

**II.** Employing the solutions  $(x, y, z)$  of (1), each of the following expressions among the special polygonal and pyramidal numbers is a perfect square.

**Conclusions**

To conclude, one may search for other patterns of solutions and their corresponding properties.
